Applied Microbial Systematics

Systematic and Applied Microbiology deals with various aspects of microbial diversity and systematics of prokaryotes. It focuses on Bacteria and Archaea; eukaryotic microorganisms will only be considered in rare cases.

This chapter is intended to be a brief introduction to the concepts and practices embraced by microbial systematics, the scientific study of the kinds and diversity of microorganisms and their relationships. The subject is generally divided into three related disciplines, the taxonomic trinity recognised by Cowan (1955), namely, classification, nomenclature and identification.

Computer-Assisted Bacterial Systematics examines the theoretical basis of numerical taxonomy and its impact on microbial classification and identification. In addition to the principles of numerical taxonomy, computer-assisted identification and the stability of classifications are discussed, along with cladistics and the evolution of proteins.

Discoveries in microbiology affect unforeseen aspects of human health, change our understanding of the environment and provide us with new opportunities to design drugs and vaccines. Many of these discoveries are driven by technological advances such as the application of next generation sequencing.

Aquifer recharge presents advantages for integrated water management in the anthropic cycle, namely, advanced treatment of reclaimed water and additional dilution of pollutants due to mixing with natural groundwater. Nevertheless, this practice represents a health and environmental hazard because of the presence of pathogenic microorganisms and chemical contaminants.

Microbial syntrophy is universal in nature, profoundly affecting the composition and function of microbiomes. We have recently reported data suggesting direct cell-to-cell interactions leading to electron and material exchange between the two microbes in the syntrophy between Clostridium ljungdahlii and C. acetobutylicum. Here, transmission electron microscopy and electron tomography ...
