16.3 Circulatory and Respiratory  
Systems Animal respiratory systems are  
designed to facilitate gas exchange. In  
mammals, air is warmed and humidified  
in the nasal cavity. Air then travels down  
the pharynx and larynx, through the  
trachea, and into the lungs.

The Circulatory System. The circulatory system is a network of vessels—the arteries, veins, and capillaries—and a pump, the heart. In all vertebrate organisms this is a closed-loop system, in which the blood is largely separated from the body's other extracellular fluid compartment, the interstitial fluid, which is the fluid bathing the cells.

The respiratory bronchioles open up into the alveolar ducts, alveolar sacs, and alveoli. Because there are so many alveoli and alveolar sacs in the lung, the surface area for gas exchange is very large. The mammalian circulatory system is a closed system with double circulation passing through the lungs and the body.
